

Defining column widths

Tables support the same width definitions as standard columns:

- auto
- star
- fixed value

width=100	star-sized	width=200	star-sized
fixed-width cells have exactly the specified width	<i>nothing interesting here</i>	<i>nothing interesting here</i>	<i>nothing interesting here</i>

This is a star-sized column. The next column over, an auto-sized column, will wrap to accomodate all the text in this cell.	I am auto sized.
---	------------------

This is a star-sized column. The next column over, an auto-sized column, will not wrap to accomodate all the text in this cell, because it has been given the noWrap style.	I am auto sized.
---	------------------

Defining row heights

row 1 with height 20	column B
row 2 with height 50	column B
row 3 with height 70	column B

With same height:

row 1	column B
row 2	column B
row 3	column B

Styling tables

You can provide a custom styler for the table. Currently it supports:

- line widths
- line colors

- cell paddings

colSpan: 3

border:
[false, false, false, false]

border: undefined	border: undefined	border: undefined
----------------------	----------------------	----------------------
